Pioneering Innovative Education

Origin of the creative idea

- Now-a-days the major problem in society is road accidents.
- Our country has an average of 1,264 road accidents per day.
- We started thinking solution for this problem.
- We finally, found a solution which can reduce accidents rate.
- In vehicles , sensors should be arranged to control the speed of vehicles with respect to condition of road and traffic

bb.

Project vision

01 To enhance safety

02 Improve efficiency and performance

03 Increase comfort and convenience

Project Mission

1. Enabling automation
2. Zero accident rate
3. Building a smart future

Ideation process

01

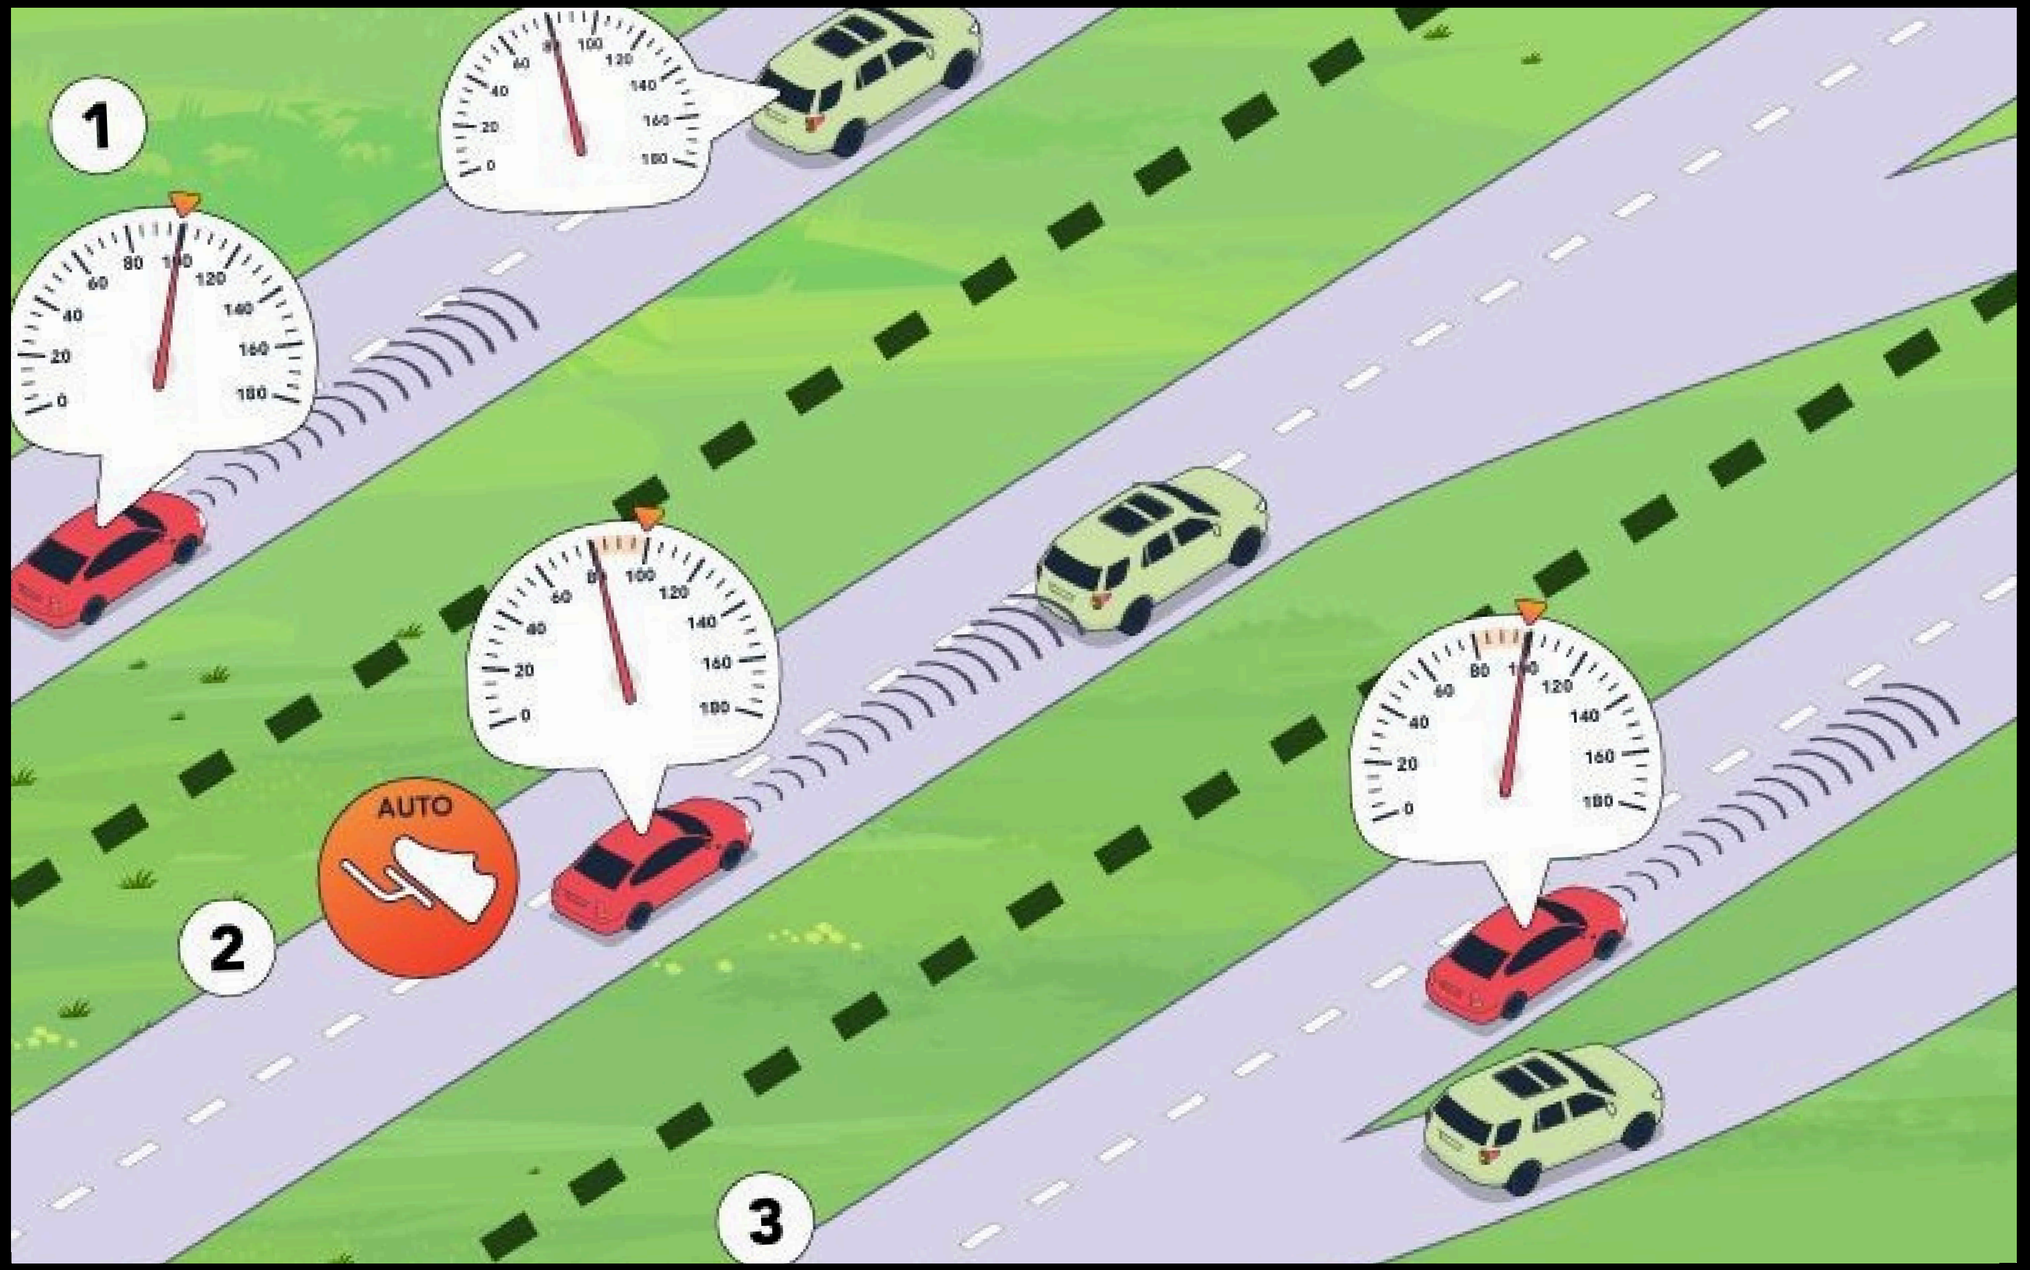

Identifying the Need (problem definition)

02

Sensor Technology Selection

03

Implementation and validation

1
2
3
AUTO

S
Strength

Ability to enhance safety, efficiency, and performance by monitoring and providing real time data about the vehicle and it's environment

W
Weakness

Susceptibility to wear and tear, contamination, harsh operating conditions like heat and vibration, and electrical problems like damaged wiring

O
Opportunity

Enhancing safety through advanced driver-assistance systems (ADAS), improving efficiency via real-time engine and battery management,and increased driver comfort

T
Threat

Cybersecurity risks like manipulation of safety -critical systems (brakes, steering) through cyber attacks ,data theft of personal information, and denial-of-service attacks that can disable sensor functions.

Final Reflections And Future Steps

enhance safety

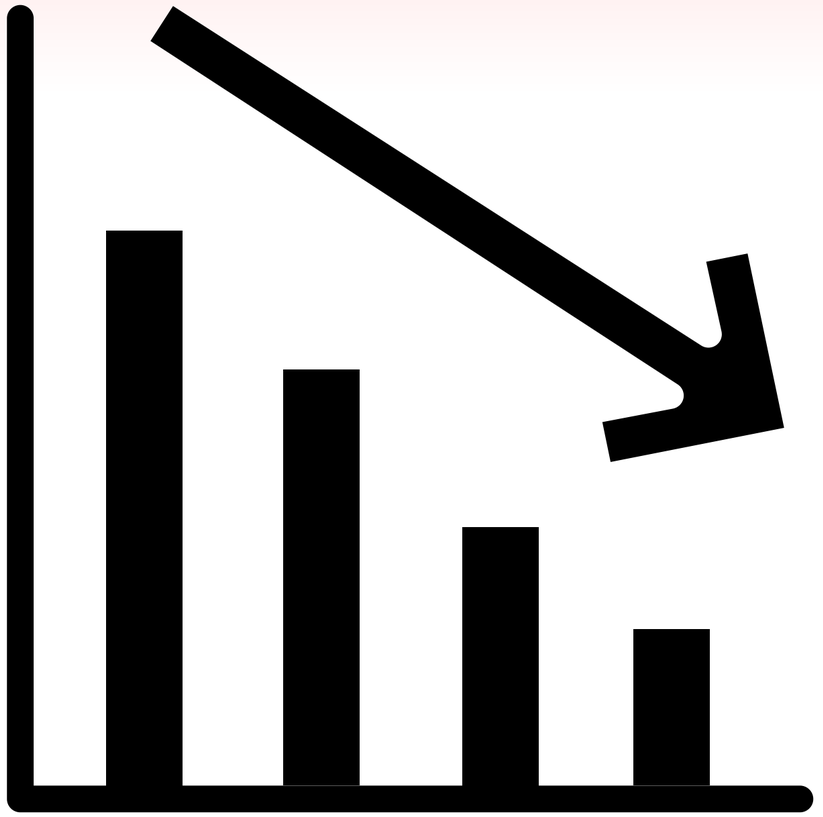

Improve Efficiency

Reduce Accident risk

Conclusion

The sensors will not only provide safety but,also they significantly reduce accidents by providing essential data that powers critical vehicle safety and driver assistance system . If these sensors are arranged in every vehicle, accident rate will decrease upto 80%

Accidents rate

THANK YOU!!!
